Healthy Caribbean 2008: A Wellness Revolution Conference
October 16-18, 2008
Barbados

Revolutionizing the Prevention and Management of Hypertension & Heart Disease

Rainford Wilks
Outline

- Approaches to the CNCD epidemic
- Evidence of the burden in Jamaica & the region
- Two main approaches
  - Shifting the distribution to the left
  - Improved detection and management
- Partnerships to achieve health
- Practical steps & essential requirements
- CVD Risk Charts
Cardiovascular diseases

- Hypertension (risk factor)
- Coronary artery disease
  - myocardial infarction, angina pectoris, congestive heart failure
- Stroke
- Peripheral vascular disease
- Kidney Disease
- Diabetes mellitus?
"The population mean predicts the number of deviant individuals"

"Objective- To examine the relation between the prevalence of deviation and the mean for the whole population in characteristics such as blood pressure and consumption of alcohol"
“Conclusions- These findings imply that distributions of health related characteristics move up and down as a whole: the frequency of “cases” can be understood only in the context of population’s characteristics. The population thus carries a collective responsibility for its own health and well being, including that of its deviants.”

“There are profound implications here for researchers, for preventive policy, and for societies and their governments”
Distribution vs Mean: Inter-Salt Study

**FIG 1** — Distributions of systolic blood pressures for averages of the five populations with the lowest mean values and the five with the highest.

Rose & Day. *BMJ* 1990
Impact of Mean on Prevalence

- Estimated 1% fall in hypertension PREVALENCE for every 1mmHg fall in MEAN BP
# Lifestyle Benefits to Blood Pressure

<table>
<thead>
<tr>
<th>Modification</th>
<th>Recommendation</th>
<th>Approximate SBP Reduction (Range)†</th>
</tr>
</thead>
<tbody>
<tr>
<td>Weight reduction</td>
<td>Maintain normal body weight (body mass index 18.5–24.9 kg/m²).</td>
<td>5–20 mm Hg/10 kg²,³</td>
</tr>
<tr>
<td>Adopt DASH eating plan</td>
<td>Consume a diet rich in fruits, vegetables, and low-fat dairy products with a reduced content of saturated and total fat.</td>
<td>8–14 mm Hg⁴,⁵</td>
</tr>
<tr>
<td>Dietary sodium reduction</td>
<td>Reduce dietary sodium intake to no more than 100 mmol per day (2.4 g sodium or 6 g sodium chloride).</td>
<td>2–8 mm Hg⁴–⁶</td>
</tr>
<tr>
<td>Physical activity</td>
<td>Engage in regular aerobic physical activity such as brisk walking (at least 30 minutes per day, most days of the week).</td>
<td>4–9 mm Hg⁷,⁸</td>
</tr>
<tr>
<td>Moderation of alcohol consumption</td>
<td>Limit consumption to no more than 2 drinks (eg, 24 oz beer, 10 oz wine, or 3 oz 80-proof whiskey) per day in most men and to no more than 1 drink per day in women and lighter-weight persons.</td>
<td>2–4 mm Hg⁹⁹</td>
</tr>
</tbody>
</table>

DASH indicates Dietary Approaches to Stop Hypertension.
*For overall cardiovascular risk reduction, stop smoking.
†The effects of implementing these modifications are dose- and time-dependent and could be greater for some individuals.

---

**TABLE 9. Lifestyle Modifications To Prevent and Manage Hypertension**

---

JNC7 Hypertension 2003
Benefits of Drug Rx to CVD

- In the presence of BP >150/90 & T-Chol >5.0 mmol/L
- Using anti-hypertensive & STATIN drugs to achieve:
  - 10-15 mmHg decrease in SBP
  - 5-8 mmHg decrease in DBP
  - 20% decrease in T-Chol
- Would yield 50% reduction in CVD mortality and morbidity

Examples of Regional Burden
### Cardiovascular Risk Factors in Jamaica 2000-01

Epidemiology Research Unit - TMRI
The University of the West Indies
Strategies to Respond to the ‘Epidemic’

- Efficient systems to estimate CNCD burden and secular trends
- Estimation of risk factors for CNCD.
- Identification of the determinants of health behaviours
- Develop a health policy to address population based approach to diseases.
- Make efficient the treatment approaches to those already afflicted

Overarching Approach

- Shifting the population \textbf{MEAN} to the \textbf{LEFT}

- Improved \textbf{DETECTION} and \textbf{MANAGEMENT}
WHO CVD Risk Charts

- Many CVD risk factors cluster (Age, Htn, DM, smoking, obesity, hyperlipidaemia)
- The impact of coincident risk factors is more multiplicative than additive
- Combined impact is best estimated from cohort studies – often unavailable in developing countries
- Colour coded Risk Charts have been available in developed countries for many years
WHO CVD Risk Charts

- The WHO has derived Colour-coded Risk charts for developing countries on the best evidence available
- These Charts are region-specific
- Charts can be used by lower levels of health care professionals to quickly identify risk
- Charts can guide the intensity of intervention
CVD Risk Charts

AMR B People with Diabetes Mellitus

Risk Level
- <10%
- 10% to <20%
- 20% to <30%
- 30% to <40%
- ≥40%

Age (years) 70 60 50 40

Male Non-smoker Smoker

Female Non-smoker Smoker

Cholesterol (mmol/l) 4 5 6 7 8

SBP (mm Hg) 180 160 140 120
High Risk – Charts not required

- BP $\geq 180/100$

- Blood cholesterol $\geq 8.0$ mmol/l

- Established Ischaemic Heart Disease

- Diabetes with renal disease
Strategic Approaches

- Advocacy for effective policy development
- Strengthening health services
- Human resources health – “fit for purpose”
- Multi-sectorial partnerships
- Improved capacity for the CNCD information “market”
Essential Partners

- Government
  - Health
  - Agriculture & Trade
  - Finance and economics
  - Public works and transportation
  - Local government
  - Statistical Institutes & Vital Registries

- NGOs

- Professional Associations

- Academic institutions

- Private sector e.g. Insurance companies

- Regional and sub-regional institutions
Some Practical Steps - 1

- Community goals must include markers of the desired outcome e.g. number of playfields per capita
- Improved detection must include increased role for NGOs (HFs, DAs)
- Increased capacity of health service to respond to the detected cases
- Improved monitoring must include the provision of subsidized home BP monitors
- Health promotion must aim to increase awareness of GOALS for each risk factor (BP, WC, FBS, Cholesterol)
Some Practical Steps - 2

- Take advantage of situations where screening is done routinely
  - Life insurance medical exams
  - College & University student medical exams
  - Work place medical exams – especially where these take place in large group-private practices
  - Annual high school medical exams

- Create an accessible interface between these organizations and the national health system
Essential Requirements

- Trained human resources with appropriate skill mix – new roles for public health inspectors and public health nurses?
- An appropriate ICT platform to accommodate this new interface between these diverse organizations already gathering the data
- Strategic improvements in the health care system to accommodate increased demand

Jamaica is in epidemiological transition. As such, more of the cardiovascular diseases have become the leading causes of death over the last fifty years.
